

## Using Rocker Picks

1. There are two types of rocker picks in your set, single sided (numbered 1-4) & double sided (lettered C-F). Determine which type is appropriate for the lock you are working with.

2. In order for a rocker pick to function properly it must be able to move freely within the keyway. Insert one of the picks into the keyway and check for free motion top & bottom.

3. Lubricate and flush out the lock with a spray silicone lubricant.

4. If you are working with an ignition lock that has a thumb turn you may use it as a means to apply a light to medium turning action. If not, satisfactory results can usually be achieved by applying tension with the pick during the picking process. Tension tools can also be used if more control is desired. Important - sidebar locks should not be picked while using turning tension. The preferred method is to apply light inward pressure to the sidebar while picking. This can be accomplished by using specially designed tension tools or by obtaining access to the sidebar.

5. With a pick inserted fully into the keyway begin vigorously rocking the pick in an upward & downward while moving the pick in and out. This will present the pick to the pins (or wafers) in a variable manner, which will provide superior success. Double-sided picks may be used on both sides for more combinations.

6. Repeat step five using all of the picks or until the lock has been picked.

7. Please do not use Rocker picks as rakes. You may move the pick forward and backward while rocking, but do not move forward and backward aggressively as this could dislodge wafers and is not effective.
