

INSTRUCTIONS

A1 Multiscope #50

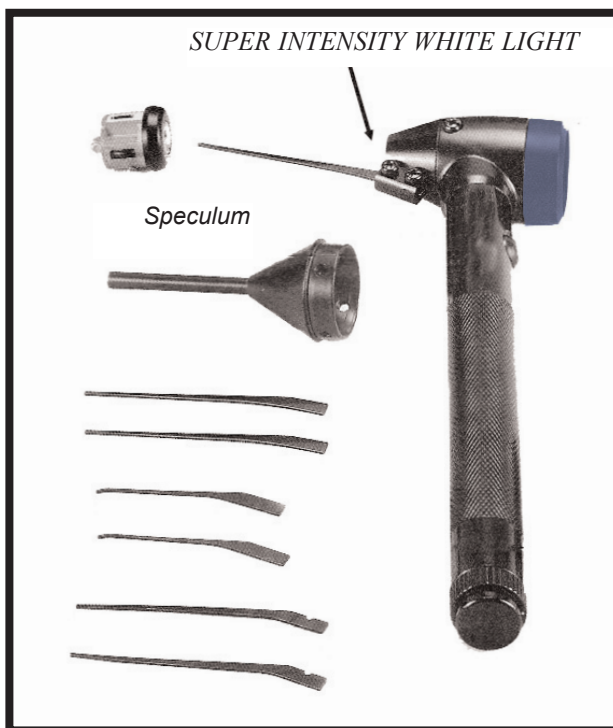

Unscrew knurled end cap and insert the two AA batteries, positive (+) end first.

Your Picking Scope comes with one of the six depressors already mounted in the scope. To change depressors loosen the two phillips head screws and replace the existing depressor with the new one. Secure by tightening the two screws.

For directing light into hard to illuminate areas such as safes, remove the standard depressor cone and install the accessory speculum. Do so by removing the three screws that retain the depressor cone and install the speculum, securing it with the three screws.

Turn the Picking Scope on by depressing the ON/OFF button located just below the eyepiece.

When using the Picking Scope to pick a lock you will need to use an appropriate tension wrench (not included in kit).
