Mortise Cylinder Force Tool

#61

This tool is designed to bypass most anti drill armor and to forcefully remove mortise cylinders that for whatever reason cannot be extracted using conventional means. As with any force tool A1 accepts no responsibility for damage that could occur while using this tool. Operator should always wear safety glasses.

Position spring loaded plunger on the prominent indentation of the keyway (the area that acts as lead-in for the key).

Rotate the tool left or right to obtain the best alignment possible with the cylinder. If the cylinder has a security ring that extends past the face of the cylinder it will center the tool for you.

Strike the end of the tool to transfer the drill points into the face of the cylinder and remove the tool.

Using a 17/64 drill bit and drill two holes a minimum of 3/8 deep (depth is measured from the tip of the drill).

Position the tool as before but this time push in until the face of the tool is against the face of the cylinder. Now with a 3/4 wrench or socket give a quick counter clockwise turn and then finish unscrewing the cylinder.

Be sure to inspect all door hardware and use new set screws when installing the new lock.
